Data Science Notebook view longer description	**1 pts** **Full Marks**	**0 pts** **No Marks**	1 / 1 pts
Participation view longer description	**2 pts** **Full Marks** **Comments** Question 1: Data inspection could be more thorough. For instance missing values such as in GSM column need to be addressed with almost the entire column missing data. Some representation of all the missing values present, cleanup method etc would make this a better attempt. Question 2: Good work with applying T-test on solving the problems.	**0 pts** **No Marks**	2 / 2 pts

08 Problem Set - Prediction (1)

Criteria	Ratings		Pts
	Comments -0.1: You are expected to train classifiers based on a full model with all possible predictors. Only 2 variables - 'sex' and 'trestbps' were included. -0.2: Missing 'training' and 'test' sets performance comparison. This is a critical step to evaluate a model's overfitting possibility. In other words, if a model's training set accuracy > test set accuracy, then this model is NOT good on 'unseen/unused' data and there is an overfitting.

	Comments missing key mathematical calculations but credits given for applying concept. Please note, this question - What is the likelihood that a sample number of tails appears in n tosses , assuming the coin is fair - is more appropriate based on 'Binomial Distribution' . You can approximate 'Poisson distribution' on a binomial distribution when the number of trials is very large and the probability of success (in your case, getting tails) is small.
