

As per Professor Gridiron, we can use Postgres instead of SQL Server. I went through the “Pubs” database SQL and extracted the CREATE TABLE and INSERT statements and converted them to Postgres SQL.

Here is evidence that the tables are built (left side) and row counts of the key tables.

The screenshot shows the DBeaver Enterprise 25.2.0 interface. On the left, the Database Navigator displays the 'uw' database with its schemas and tables. The 'titles' table is selected, showing its columns and data types. On the right, the SQL editor contains a query to count the number of rows in the 'authors', 'titles', and 'titleauthor' tables. The Results pane at the bottom shows the output of the query, which is a table with three rows and two columns: 'tbl' and 'ct'.

	tbl	ct
1	titleauthor	25
2	authors	23
3	titles	18

Attached are my SQL files converted.
